

Fotochemia – *zagadnienia*

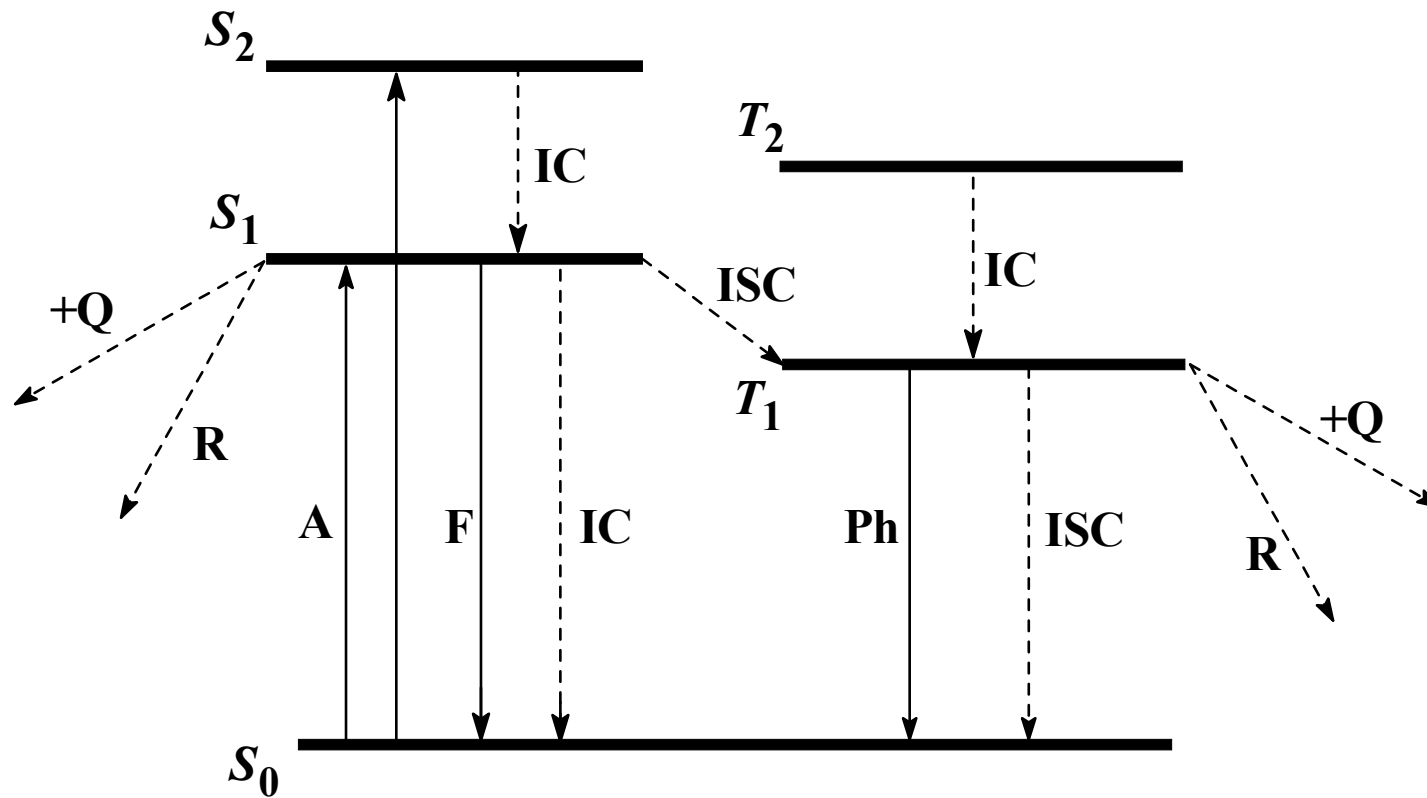

1. Spektroskopia UV/VIS – widma absorpcji i prawa absorpcji.
2. Stany elektronowo wzbudzone cząsteczek.
3. Wewnątrzcząsteczkowe i międzycząsteczkowe procesy fizycznej dezaktywacji stanów elektronowo wzbudzonych: fluorescencja i fosforescencja, wygaszanie stanów wzbudzonych.
4. Mechanizm przeniesienia energii wzbudzenia i przeniesienia elektronu.
5. Reakcje fotochemiczne – typy reakcji, wydajność kwantowa reakcji fotochemicznej.
6. Aparatura i metody stosowane w nowoczesnych badaniach fotochemicznych i fotofizycznych.
7. **Mechanizmy wybranych reakcji fotochemicznych.**
8. Zastosowanie procesów fotochemicznych.

PRZYKŁADY

**Przeniesienie energii
i przeniesienie elektronu**

Jabłoński diagram

Intermolecular Excited-State Reactions

- Energy Transfer

- Electron Transfer

- Hydrogen Abstractions

Note:

Have to have excited states that live long enough to find quenching partner by diffusion

Kinetic of quenching

	<u>rate</u>
$R(S_0) \xrightarrow{h\nu} R(S_1)$	I_a (einstein $\text{dm}^{-3} \text{s}^{-1}$)
$R(S_1) \rightarrow R(S_0) + h\nu_f$	$k_f [R(S_1)]$
$R(S_1) \rightarrow R(S_0) + \text{heat}$	$k_{IC} [R(S_1)]$
$R(S_1) \rightarrow R(T_1)$	$k_{ISC} [R(S_1)]$
$R(S_1) \rightarrow B + C$	$k_r [R(S_1)]$
$R(S_1) + Q \rightarrow \text{quenching}$	$k_q [R(S_1)] [Q]$
$R(T_1) \rightarrow R(S_0) + h\nu_p$	$k_p [R(T_1)]$
$R(T_1) \rightarrow R(S_0) + \text{heat}$	$k'_{ISC} [R(T_1)]$
$R(T_1) \rightarrow B' + C'$	$k'_r [R(T_1)]$
$R(T_1) + Q \rightarrow \text{quenching}$	$k'_q [R(T_1)] [Q]$

Kinetic of quenching

Energy transfer

Stern-Volmer equation

for T_1

$$\frac{\Phi_p^0}{\Phi_p} = 1 + k'_q \tau_T^0 [Q]$$

$$\frac{\Phi'_R{}^0}{\Phi'_R} = 1 + k'_q \tau_T^0 [Q]$$

$$\frac{\tau_T^0}{\tau_T} = 1 + k'_q \tau_T^0 [Q]$$

$$\frac{1}{\tau_T} = \frac{1}{\tau_T^0} + k'_q [Q]$$

$$k_{obs} = k^0 + k'_q [Q]$$

$$\tau_T^0 = \frac{1}{k_p + k'_{ISC} + k'_r}$$

$$\tau_T = \frac{1}{k_p + k'_{ISC} + k'_r + k'_q [Q]}$$

Stern-Volmer equation

Sensitized emission of Q

$$\frac{1}{\Phi_Q} = \frac{1}{\eta_Q} \left(1 + \frac{1}{k'_q \tau_T^0 [Q]} \right)$$

modified Stern-Volmer equation

$$\eta_Q = k''_e / (k''_e + k''_d + k''_r)$$

(observation of any process from Q* gives a direct evidence for the participation of energy transfer)

Energy transfer – example

Quenching of triplet states of organic compounds by lanthanide 1,3-diketonate chelates in solutions

B. Marciniak, G. L. Hug, *J. Photochem. Photobiol. A: Chemistry*, **78**, 7-13 (1994)

B. Marciniak, G. L. Hug *Coord. Chem. Rev.* , **159**, 55-74 (1997)

Benzophenone phosphorescence in the presence of $\text{Eu}(\text{acac})_3$ ($\lambda_{\text{ph}} = 455 \text{ nm}$)

Stern-Volmer plot for quenching of BP phosphorescence by $\text{Eu}(\text{acac})_3$ in benzene

Modified Stern-Volmer plot for emission of $\text{Eu}(\text{acac})_3$ in benzene

for $\text{Eu}(\text{acac})_3$:

quenching: $K = k_q \tau_T^0 = (1.93 \pm 0.16) \times 10^3 \text{ M}^{-1}$

sensitization: $K = k_q \tau_T^0 = (2.3 \pm 0.6) \times 10^3 \text{ M}^{-1}$

$$K_{\text{quenching}} = K_{\text{sensitization}}$$

$$\tau_T^0 = \text{constant}$$

$$k_q (\text{from quenching}) = k_q (\text{from sensitized emission})$$

Decay of benzophenone triplet ($\lambda_{TT} = 530 \text{ nm}$) and rise of Tb(III) emission ($\lambda_e = 550 \text{ nm}$)

$$k_{\text{decay}} = 2.2 \times 10^5 \text{ s}^{-1}$$

$$k_{\text{rise}} = 2.7 \times 10^5 \text{ s}^{-1}$$

Energy transfer from benzophenone triplet state
to the ligand localized triplet state

Sandros relation:

$$k_q/k_{dyf} = [1 + \exp -(E_T(D) - E_T(Q))/RT]^{-1}$$

Rates of energy transfer vs donor-acceptor energy differences

$$k_q/k_{dyf} = [1 + \exp - \Delta E_T/RT]^{-1}$$

Electron transfer – example

Excited Triplet State of N-(9-Methylpurin-6-yl)pyridinium Cation as an Efficient Photosensitizer in the Oxidation of Sulfur-Containing Amino Acids

(B. Marciniak, G.L. Hug, J. Rozwadowski, K. Bobrowski, *J. Am. Chem. Soc.*, **117**, 127 (1995))

Steady-state Photolysis

1. Identification of stable products:

Pyr-Pyr dimer

CO₂

2. Quantum yields:

Φ_{Pyr^+} and Φ_{CO_2}

Short-lived reactive intermediate Pyr[•]

Pyr^{•+}

1) Flash photolysis:

$$([\text{Pyr}^+] = 2 \times 10^{-4} \text{ M}, [\text{Q}] = 0.01 \text{ M}, \text{pH} = 6.5)$$

$$\lambda_{\text{max}} = 610 \text{ nm}$$

$$\epsilon_{\text{max}} = 5.4 \times 10^3 \text{ M}^{-1}\text{cm}^{-1}$$

(el. transfer quenching by DMA
for DMA⁺ $\epsilon_{470} = 4500 \text{ M}^{-1}\text{cm}^{-1}$
Holcman et al. 1977)

2) Pulse radiolysis:

$$\lambda_{\text{max}} = 610 \text{ nm}$$

$$\epsilon_{\text{max}} = 4.8 \times 10^3 \text{ M}^{-1}\text{cm}^{-1}$$

Secondary reactions of Pyr⁺

For thiaproline: $\text{Pyr}^+ + \alpha\text{N} \rightarrow \text{Pyr}^\bullet + \text{Products}$

Table
Quantum yields for Pyr[•] formation
and Pyr⁺ disappearance

quencher	flash photolysis			steady-state photolysis	
	$\Phi_{\text{Pyr}^{\bullet}}$ ^{a)}	$\Phi'_{\text{Pyr}^{\bullet}}$ ^{a)}	$\Phi_{\text{Pyr}^{\bullet}}$ ^{sum b)}	Φ_{Pyr^+}	$\Phi_{\text{Pyr}^+}/\Phi_{\text{CO}_2}$
thiaproline	0.31	0.32	0.63	0.61 ^{a)}	1.8
methionine	0.27	d)	0.27	0.20 ^{b)}	2.5
2,2'-thiodiethanoic acid	—	—	—	0.15 ^{c)}	1.1

a) experimental error $\pm 10\%$

b) sum $\Phi_{\text{Pyr}^{\bullet}} + \Phi'_{\text{Pyr}^{\bullet}}$

c) experimental error $\pm 10\%$

d) not observed

Conclusions

1. The electron transfer from the sulfur atom to the triplet state of Pyr⁺ was a primary photochemical reaction:
 - ❑ direct observation of electron transfer intermediates Pyr[•] and (S.:S)⁺ dimer
 - ❑ detection of Pyr-Pyr (stable product)
 - ❑ $k_q \sim 2 \times 10^9 \text{ M}^{-1}\text{s}^{-1}$ for quenching by sulfur-containing amino acids
 - ❑ $k_q \sim 10^6 \text{ M}^{-1}\text{s}^{-1}$ for quenching by alanine
 - ❑ $\Delta G_{el} \sim -100 \text{ kJ/mol}$

Conclusions

2. The slow formation of Pyr^\bullet radicals (on microsecond time scale) was assigned to the one-electron reduction of Pyr^+ by the α -aminoalkyl radicals (αN) produced in the decarboxylation of $\text{S}^{+\bullet}$ radicals

- linear dependence of pseudo-first order rate constant k_{obs} vs. $[\text{Pyr}^+]$
- generation of αN radicals and their kinetic studies in the complementary pulse radiolysis experiments

Standard free energy change for electron transfer (the driving force for the process)

$$\Delta G_{el} = F(E_{ox} - E_{red}) - E_T + \Delta w$$

for Pyr⁺ : $E_{red} = -0.57 \text{ V}$

$$E_T = 268 \text{ kJ/mol (64 kcal/mol)}$$

for methionine: $E_{ox} = 1.1 \text{ V}$

$$\Delta w = 0$$

$$\Delta G_{el} = -107 \text{ kJ/mol}$$
